Rewindo
Fenster-Recycling-Service

Press release June 3, 2024

Metal-Plast joins Rewindo as a Recycling Partner

Świebodzice / Bonn (prs). – In the more than 20 years since the establishment of Rewindo GmbH Fenster-Recycling-Service, a network of recycling partners has been built across Germany, Austria, and Belgium. With the addition of Metal-Plast Sp. z o.o., the circle of partners within the Rewindo system for the recycling of end-of-life PVC windows, doors, and roller shutters has expanded once again.

Following a successful audit, Metal-Plast Sp. z o.o. has been classified as a Class 1 recycling partner. This means that the company covers the entire recycling chain, from the collection of old windows and production waste to the reprocessing of PVC granulate, which is then reused in the manufacture of PVC profiles for new window systems.

Even more active in Circular Recycling

Rewindo is an industry-wide solution that organizes and manages the recycling of old PVC (polyvinyl chloride) windows, doors, and roller shutters in Germany. Its objective is to promote and implement sustainable waste management within the construction sector through the collection, processing, and recycling of PVC materials.

"We are very pleased to join the Rewindo network, which enables us to become even more active in the field of circular economy solutions for end-of-life PVC windows, particularly in Germany," said Jędrzej Nosko, Market Development Director.

A Valuable Addition to the Rewindo System

"The partnership with Metal-Plast is not only a valuable addition to the Rewindo system in Germany, but it also expands the opportunities for our cooperation with OknoRec, the Polish clearing organization for the recycling of end-of-life PVC windows," said Michael Vetter, Managing Director of Rewindo GmbH.

Both Rewindo and OknoRec are members of EPPA and partners of Recovinyl and VinylPlus.

Growing demand for replacement windows in Poland

For the past 30 years, Metal-Plast has continuously focused its activities on the professional recycling of PVC windows. Today, the company is one of the largest rigid PVC recyclers in Europe and collaborates with more than 800 window manufacturers.
As the process of energy-efficient building renovation continues to advance in Poland, the company has also introduced a new service there: the recycling of removed PVC windows. Metal-Plast is RecyClass-certified and has been a member of EPPA and the Recovinyl initiative for many years.

Each year, the facility in Świebodzice processes up to 30,000 tonnes of PVC, returning it as a high-quality raw material to window profile manufacturers. This results in savings of more than 60,000 tonnes of CO_2 emissions annually.

Poland is currently experiencing growing demand for new windows, making the management of post-consumer PVC waste an important area of development for Metal-Plast. The company is currently working on a project to increase its recycling capacity to approximately 45,000 tonnes per year, further strengthening its contribution to the circular economy.

Sustainability as a challenge

"Sustainability is not a trend, but a challenge. Particular emphasis must be placed on the efficient use of resources and the prevention of waste. One of the keys to achieving this is a closed material loop. We believe that our partnership with Rewindo will contribute to an even more efficient circular flow of PVC waste," concluded Marta Uciechowska-Sówka, Trade and Marketing Director at Metal-Plast.
